1. A method for facilitating behavioral assessments and monitoring mental health patients over a computer network, comprising:

receiving a subject's personal information and behavior-related medical;

storing said personal information and behavior-related medical history in a computer storage medium;

selecting general behavioral assessment questions based upon said personal information and behavior-related medical history;

outputting said general behavioral assessment questions for prompting general responses by persons having knowledge of said subject's behavior;

receiving and storing responses said general responses;

selecting and outputting disorder specific behavioral assessment questions for prompting specific responses by said persons;

receiving and storing said specific; and

outputting diagnostic behavioral assessment information based on said general and specific responses.

2. The method of claim 1, further comprising receiving and storing payment information to the storage medium.

3. The method of claim 1, further comprising storing and outputting said subject's medication information.

4. The method of claim 1, further comprising storing and outputting articles and other information related to said subject's disorder.

5. The method of claim 1, further comprising receiving, storing and outputting referring medical provider information.

6. The method of claim 1, further comprising receiving, storing, outputting subject-to-subject messages in a patient message forum

7. The method of claim 1, further comprising receiving behavioral disorder or learning difficulty information search requests, and searching for, retrieving and outputting said behavioral disorder or learning difficulty information.

8. The method of claim 1, further comprising an assessment tool.

9. The method of claim 8, wherein said assessment tool permits parents to access authorized assessments, completed assessments, expired assessments, and a behavioral health record of a patient.

10. The method of claim 1, further comprising:

comparing all input requests against a list of authorized persons; and

granting or denying said input requests based upon said comparing step.

11. An information system for facilitating behavioral assessment and monitoring of patients over a computer network, comprising:

a processor; and

a storage device, said storage device including a program for controlling the processor, said program comprising:

(a) receiving and storing personal information and medical history information concerning a patient from persons with required information;

(b) outputting general behavioral assessment questions to ones of the persons with required information;

(c) receiving and storing general responses to the general behavioral assessment questions;

(d) outputting specific behavioral assessment questions based upon said personal information, medical history and general responses;

(e) receiving and storing specific responses to the specific behavioral assessment questions; and

(f) outputting diagnostic behavioral assessment information based on said personal information, medical history, general responses and specific responses.

12. The information system of claim 11, wherein the behavioral assessment questions are assessment scales administered to evaluators for treating learning disorders.

13. The information system of claim 12, wherein the assessment scales are provided to ones of the persons, including parents of the patient and teachers of the patient.

14. The information system of claim 11, wherein the program further comprises the step of accessing responses to the behavioral assessment questions by ones of the persons.

15. The information system of claim 14, wherein the ones of the persons accessing the responses to the behavioral assessment questions access the same responses over the Internet from respective remote locations.
